Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                             This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonuclectides, ribozymes, antibudur agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cpds. based on protegrin(s) and tachyplesin(s) - designated tachytegrin(s) and parevin(s), useful as antimicrobial and antiviral agents, e.g. for treatment of sexually transmitted diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protegrin; tachyplesin; antimicrobial; antiviral; oral mucositis; sexually transmitted disease; endotoxin; HIV; Staphylococcus aureus; Pseudomonas; H. pylori; Chlamydia trachomatis; Treponema pallidum; Neisseria gonorrhoeae; Trichomonas vaginalis; Herpes simplex type 2; animal; plant.

The present sequence represents a peptide sequence found in compounds based on protegrins and tachyplesins, designated tachytegrins and parevins. The present sequence is from a tachytegrin as the peptide has correctly residues at positions a parevins have Cys residues at positions 5 and 16. Both compounds can be used as preservatives (e.g. positions 5 and 16. Both compounds can be used as preservatives (e.g. in foodstuffs, cosmetics or medicaments) or in treatment of viral or microbial infection in animals or plants. They are useful, e.g. in microbial infection in animals or plants. Taphylococcus aureus, treatment of oral mucositis, infection by Staphylococcus aureus, those caused by Chlamydia trachomentis, Treponema pallidum, Neisseria, gonorrhoeae, Trichomonas vaginalis, Herpes simplex type 2 and HIV. DNA encoding the compounds can also be expressed in situ, in animals or plants, to combat infections. The compounds can also be used as standards in antimicrobial assays and in binding endotoxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a peptide sequence found in compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cpds. based on protegrin(s) and tachyplesin(s) - designated tachytegrin(s) and parevin(s), useful as antimicrobial and antiviral agents, e.g. for treatment of sexually transmitted diseases

 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
        parevins. The present sequence is from a tachytegin as the peptide has Cys residues at positions 4 and 17, where parevins have Cys residues at positions 5 and 16. Both compounds can be used as preservatives (e.g. in foodstuffs, cosmetics or medicaments) or in treatment of viral or microbial infection in animals or plants. They are useful, e.g. in freatment of oral mucositis, infection by Staphylococcus aureus, Pseudomonas or H. pylori, or sexuelly transmitted diseases, including those caused by Chlamydia trachomatis, Treponema pallidum, Neisseria gonorrhoeae, Trichomonas vaginalis, Herpes simplex type 2 and HIV. DNA encoding the compounds can also be expressed in situ, in animals or plants, to combat infections. The compounds can also be used as standards in antimicrobial assays and in binding endotoxins.
                                                                                                                                                                                                                    Gaps

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,

which represent the human ORFX open reading frames 1 to 3161. The ORFX
continoses have activities such as: cytostatic; hepatotropic; vulnerary;
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
antipostiatic; antipostiatis antiathritic; immunosuppressant;
costeopathic; anticonvulsant; antiathritic; immunosuppressant;
contidiabetic; hypotensive; dermatological; immunosuppressive;
antidiabetic; hypotensive; dermatological; immunosuppressive;
antithyroid; and antianaemic. The sequences can be used for determining
antithyroid; and antianaemic. The sequences can be used for determining
the presence of or predisposition to, or preventing or treating
the presence of or predisposition to, or preventing or treating
pathological conditions associated with an ORFX-associated disorder. The
public acids can be used to express ORFX proteins in gene therapy
conclierative disorders, neurodegenerative disorders, osteoarthritis,
confiderative disorders, neurodegenerative disorders mellitus,
cardiovascular disease, diabetes mellitus,
                                                                                                                                                                                                                                                                                                                                                                            Human; open reading frame; ORFX; detection; cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; osteopathic; antiarthritic; immunosuppessant; cardiant; minunosuptant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antitinacterial; antifungul; antirheumatic; antithyroid; antitinacterial; antifungul; antirheumatic; antithyroid; cancin; encuodegenerative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; StDD; cardiovascular disease; diabetes mellitus; hypothyroidism; StDD; severe combined immunodeficiency; malaria, autoimmune disorder; asthma; allergy; aplastic anaemia; nocturnal haemoglobinuria; burn; wound; thrombolic; contrareactive; antiinflammatory disease; coagulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel polynucleotide isolated from human immunodeficiency virus type 1 subtype C/B' which can be used for the immunodeficiency virus type 1 subtype C/B' which can be used for the induction of specific humoral and cellular immune responses. (I) and induction of specific humoral subtype control of the statement of prevention of human immune deficiency virus-1 (HIV-1) infections, also for rational of human immune deficiency virus-1 (HIV-1) infections, also for rational continuant of test or therapeutic reagents, or gene therapy vectors.

The polypeptides, especially antibodies, specifically directed against (II) are similarly useful as pharmaceutical and diagnostic agents. (I) are specific for intersubtype C/B' of HIV-1 so are useful in regions (particularly China and South-East Asia) where this subtype is prevalent. The products of the invention have antiviral activity. This sequence crepresents a protein encoded by the HIV-1 subtype C genome described in the method of the invention.

                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and
hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                           Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation; leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonclectide complementary trand of a polynuclectide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonuclectide comprises at least 15 nucleotides; or (b) a combination
immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous that a coalised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thiombolytic activity, chemoclactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                     C.N.S disorders.
Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; primer; detection; diagnosis; antisense therapy; gene therapy.
                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Saito K, Yamamoto J;

complementary strand of a polynucleotide which comprises a 5 -end complementary strand of a polynucleotide which comprises a 5 -end comprised and an oligonucleotide comprising a sequence complementary to a sequence and an oligonucleotide comprises a 3 -end sequence, where the polynucleotide which comprises a 3 -end sequence, where the compination of oligonucleotide which comprises a 1 -east 15 nucleotides and the compination of the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in gene therapy. The primers are useful for synthesising polynucleotides, in gene therapy. The primers are useful for the particularly full-length conwas. The primers are also useful for the checking and/or diagnosis of the abnormality of the proteins encoded by the full-length conwas. The primers allow obtaining of the full-length conwas assily without any specialised methods. AnH03166 to AAH13632 AAH13633 represent human amino acid sequences; and AAH13632 to AAH13632.
                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Wang D;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                      The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activity and Shy-Drager Syndrome other uses include the Activinibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                         C.N.S disorders.

in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinolibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, concer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                           The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

BIOL. Chem. 268:24394-24401(1993).

-!- FUNCTION: DISPLAYS A BROAD RANGE OF SUBSTRATE SPECIFICITY, WITH THE CAPACITY TO HYDROLYZE CARBOHYDRATES AS SIMPLE AS MALTOTRIOSE.

-!- CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF 1,4 -ALPHA-GLUCOSIDIC
LINKAGES IN OLIGOSACCHARIDES AND POLYSACCHARIDES.
-!- PATHWAY: POLYSACCHARIDE DEGRADATION.
-!- SUBUNIT: HOMODIMER.
-!- SUBUNIT: HOMODIMER.
-!- MISCELLANEOUS: THE ISOELECTRIC POINT IS 4.3. THE ENZYME DISPLAYS OPTIMAL ACTIVITY, WITH SUBSTANITAL THERMAL STABILLITY, AT 100 DEGREES CELSIUS.

DEGREES CELSIUS.

The present sequence is a polypeptide encoded by one of a large number of 5. ESTs derived from mRNAs encoding secreted proteins. The 5. ESTs expressed from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3. Contranslated region (UTR) of the mRNA because they are often obtained untranslated region (UTR) of the mRNA because they are often obtained isolating cohn sequences derived from the 5. ends of mRNAs and even in isolating cohn sequences derived from mRNAs with intext 5. Those cases where longer cDNA sequences have been obtained, the full 5. The isolating can therefore be used to obtain full length cDNAs and genomic DNAs. 5. ESTs are derived from mRNAs with intext 5. DNAs. 5. ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream chromosome mapping procedures. They are used to obtain upstream croulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Plant; transcription factor; gene expression; eucalyptus; pine; acacia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleic acid sequences obtained from the VRNZ locus of a plant encode polypeptides which are capable of affecting one or more vernalization responses such as, flowering time, leaf size and/or shape or the shade avoidance response of a plant into which the nucleic acid is introduced. Introducing such sequences into plants to alter these characteristics maximises the reproductive success of the plant. This protein is encoded an isolated human sequence which has homology to the Arabidopsis thaliana VRNZ gene over a short region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated vernalization gene VRN2 is used to produce transgenic plants with altered vernalization response, flowering time, leaf size and/or shape or shade avoidance response for maximized reproductive success
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, belix.loophelix zipper, homeotic/homeodomain/homeobox/MADS, homeodomain cys2His2, CCAAT box elements and MYB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of human TASK1 (TWIK-related acid-sensitive K+ channel), a member of a new family of 2P domain potassium channels, also including TWIK-1 (see AAY79673) and novel TASK2 (see AAY79675). TASK1 is expressed in many different tissues, and at particularly high levels in pancreas and placenta. C Host cells expressing TWIK-1 family members can be used to screen for substances that modulate the activity of members of the TWIK-1 family of potassium channels. The drugs identified may be useful in the treatment of diseases of the heart or of the nervous system, such as epilepsy, arrhythmia, vascular diseases, neurodegenerative diseases, kidney, liver or pancreas diseases, hypertension, diseases associated with ischaemia or anoxia, endocrine diseases associated with anomalies of hormone secretion,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding a non-inactivating outwardly rectifying potassium transport channel, designated TASK2, useful in the treatment of hypertension or dysfunctions of the kidney, liver or pancreas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11-MAY-2000
                                                                                                                                                                                                                                                                                                                               18-MAY-2000
```

A human proliferation and apoptosis related protein.

21-AUG-2000 (first entry)

AAY84906;

AAY84906 standard; Protein; 526 AA.

```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ AAZ98109 to AAZ98242 encode AAX87224 to AAX87357 which represent the chuman signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have controlled and entiasthmatic activities, and can neuroprotective, cardiovascular and antiasthmatic activities, and can neuroprotective, cardiovascular and antiasthmatic activities of associated with decreased activity or function of HSPP. Such diseases include cell proliferation (HSPP act used to treat or prevent diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, (including cancer), inflammation, cardiovascular, neurological, creproductive or developmental disorders, (e.g. arteriosclerosis, corganic assemic heart disease, microbial or other infections, congestive or schman, can be used for the recombinant production of HSPP diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP diseases, schizophrenia, ovulatory defects, muscular dystrophy), HSPP diseases, schizophrenia, ovulatory defects, muscular dystrophy), HSPP diseases, schizophrenia, ovulatory defects, muscular dystrophy), HSPP cucleic acids can be used for the recombinant production of HSPP, cor genetic variations, and for chromosomal mapping HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and cancer diseases (Ab) and to screen for agonists or antagonists (potential therapeutic agents). Ab are used to diagnose, or antagonists forcential therapeutic agents). Ab are used to diagnose, or antagonists, in competitive drug screens, and for purification of HSPP controlled antagonists, and an amplement or succession of the prerepeutic antagonists, in competitive drug screens, and for purification of HSPP controlled to the control or purification of HSPP controlled or antagonists, and an advanced to diagnose, or some drugonists and antagonists, and controlled the control or purification of HSPP controlled to the control or purification of HSPP controlled 
antiasthmatic; gene therapy; cell proliferation; neurological disorder; reproductive disorder; developmental disorder; arteriosclerosis; cirrhosis; psoriasis; acquired immune deficiency syndrome; anaemia; asthma; Crohn's disease; infection; Alzheimer's disease; schizophrenia; Parkinson's disease; Huntington's diseases; ovulatory defect;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tang YT, Gorgone GA, Corley NC, Guegler KJ, Baughn MR;

                                                                                                                                                                        The present sequence represents a human proliferation and apoptosis related protein (PROAP). The polypeptides and polynuclectides can be used for the diagnosis, treatment and prevention of cell proliferative, immunological and reproductive disorders. Disorders associated with decreased expression or activity of include arteriosclerosis, cirrhosis, hepatitis, psoriasis, melanoma, lymphoma and cancers of the breast, brain and prostate, acquired immune deficiency syndrome (AIDS), allergies, anaemla, asthma, diabetes mellitus, osteoarthritis, andergies, uterine fibroids and disruptions of the mensitual cycle. Antibodies against PROAP can be use in diagnosis of disorders characterized by PROAP e.g. in ELISA (enzyme linked immunosorbent systs) and the polynuclectides may be used to detect and quantify gene expression in biopsied tissues. These techniques can also be used to monitor regulation of PROAP levels during therapeutic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                          New human proliferation and apoptosis related protein polypeptides used for diagnosis, treatment and prevention of cell proliferative, immunological and reproductive disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; primer; detection; diagnosis; antisense therapy; gene therapy.

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence. Where the
oligonucleotide which comprises a 1'-end sequence, where the
oligonucleotide which comprises a 1'-end sequence, where the
oligonucleotide of the primer sets can be used in antisense therapy and
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
connection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
cDNAs easily without any specialised methods. AAH03658 and

  The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with used to produce Rht mutant plants which are dwarfed compared with which the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by the wheat Rht clone Sal genomic sequence.
                                                                                                                                                                                                                                                                                                                    ;

The E2A gene (see AAQ13669), encoding immunoglobulin enhancer-binding CC factors E12 and E47 (see AAQ13670 and AAQ13671), is localised to the breakpoint of a consistently recurring chromosomal translocation composed in many acute leukemias and is structurally altered by most present in many acute leukemias and is structurally altered by most (17.19) chromosomal translocations. The translocation results in cypthesis of a fusion mRNA (see AAQ13672 for fusion cDNA) that crosses synthesis of a fusion mRNA (see AAQ13672 for fusion cDNA) that crosses composite nucleotide sequences of the SUP-B27 fusion cDNAs were composed and represented in a composite sequence (see AAQ13672). CC determined and represented in a composite sequence (see AAQ13672). Cc clone KJ9 differs from the other four fusion cDNAs in that it has a cloodes a predicted 80 KD protein. The KJ9 variant concodes a predicted fusion proteins contd. the amino two-thirds of although the predicted fusion proteins contd. the amino two-thirds of dimerisation motif, which was replaced by a polypeptide encoded by conclaps with a region in homeoproteins that correspond to their correspond to their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

present in many acute leukemias and is structurally altered by most tilly chromosomal translocation present in many acute leukemias and is structurally altered by most tilly) chromosomal translocations. The translocation results in synthesis of a fusion mRNA (see AAQ13672 for fusion cDNA) that crosses the breakpoint between chromosome 1 and 19.

The complete nucleotide sequences of the SUD-B27 fusion cDNAs were determined and represented in a composite sequence (AAQ13672).

The fusion cDNAs encode a 85 kD protein. Clone KJ9 differs from the other four fusion cDNAs in that it has a small deletion of chromosome 1-derived DNA (see AAQ13673).

Although the predicted fusion proteins contd. the amino two-thirds of EZA, they no longer retained the helix-loop-helix DNA-binding and climatisation motif, which was replaced by a polypeptide encoded by overlaps with a region in homeoproteins that correspond to their
factors E12 and E47 (see AAQ13670 and AAQ13671), is localised to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunoglobulin; enhancer-binding factor; chromosomal translocation;
